

AEGIS LAB CHAT CONTEXT

Captured: 2026-09-21

SOURCE CHAT EXCERPT

Saketh Neeli: R u guys coming at 2 today?

Yash: I'll come around 3

Saketh Neeli: Im heading over now

Saketh Neeli: looking good

Overleaf shared: <https://www.overleaf.com/5164493351kcwttdqxwfbk#d6b03c>

Yash: Slide ur email @+14082396135

Shivaan Karanth: Karanthshivaan@gmail.com

Yash: Anyone going to the lab today?

Saketh Neeli: Going tmrw

Yash: I'll come tmrw as well. yo lets all hit up lab tmrw

Saketh Neeli: I cant come. Me and zaidi planned to record a movie next week

Yash: I worked on a abstract with him last week asw. movie? wdym

Saketh Neeli: Like a recording of the device working

Yash: ohh i see. is there anything in particular you want me to do tmrw

Saketh Neeli: Idk, im just working on the paper rn. Get some renders ready etc

Yash: cause i built an automation system that takes in cv and moves robot + manages plasma intensity respectively. and i wanted to try load that onto the robot itself tmrw

Saketh Neeli: Cv?

Yash: yup. it translates that into a system of coordinates with marker data. i'll commit it today

Saketh Neeli: Do we need a diff camera for that?

Yash: the pixy works just fine. i ended up using a degraded version of it, i'll ask zaidi if we lidar sensors cause i can build a separate implemetation for that

Shivaan Karanth: Yo good shit

Boyd: Boys Sorry I have lowkey been busy with college apps I'll come next weekend

EXTRACTED TECHNICAL CONTEXT

- The team is preparing a paper/abstract and demo recording for AEGIS.
- Immediate software goal: use CV data to generate coordinates, move the robot, and modulate plasma intensity.
- Current camera assumption: Pixy/Pixy2 is sufficient for a degraded implementation.
- Possible future sensor path: LiDAR/depth sensor implementation if hardware is available.
- Near-term lab task: get renders ready and load/test the automation system on the robot.
